

# Install kickstart script

---

I have created a kickstart script for ESX 3.5 installation, which is working fine apart from adding user roles

The following command works fine after my installation is completed but will not work on the script

```
vmware-vim-cmd vimsvc/auth/entity_permission_add vim.Folder:ha-folder-root 'username'  
false Admin true
```

Any help will be highly appreciated

Install kickstart script
