

VmWare Server environment, start from...

Hi,

In our company we still work the classical way with server. One hardware server with a linux or windows for one or more services.

We would like to convert everything to a virtual space with VmWare ESX. (Maybe not Exchange).

We would like to manage the migration ourselves and avoid expensive installation costs.

In Cannes, we want to get information about Licensing, hardware to use, fault tolerance, clustering, network design in VM and disk management.

How should we organize? Wich labs and sessions do we have to attend and who do we have to meet?
