Unfortunately we can't be at Cannes this time, therefore we chose the "virtual way" to get into contact. Questions and feedback welcome:

[fluid Operations](#) started the public Beta campaign for its new product "eCloudManager - Storage Edition".

With [eCloudManager](#), storage hardware (like NetApp filers) and virtualized server infrastructure (like VMware) can be managed together from a single, multifeatured console.

Virtual machine provisioning and cloning now use the storage's enhanced features instead of lengthy copy operations. With this advantage, enterprise systems, like e.g. SAP ERP, can be made available in an enterprise cloud ("eCloud").

New Management Solution for Enterprise...

Additionally, eCloudManager also fully integrates into the VMware Virtual Infrastructure management console.

-

fluid Operations focuses on solving today's complex cloud computing challenges with truly innovative technologies.

Together with SAP, fluidOps deployed a large computing infrastructure based on virtualization technology from VMware and storage technology from NetApp. The project proves that enterprise applications like SAP R/3 can be deployed on demand in an enterprise compute cloud.

Interesting stuff! Do you have some documentation online that describes the feature set in a bit more detail?

 in response to: [Mike Johnson](#)

The eCloudManager manual that describes the product's screens, tabs and wizards in more detail is available online at:

Apart from that, we are currently preparing more material (case studies, whitepapers, etc.) that we will put online bit by bit. Please stay tuned!
